Obciążenie miejskiej ścieżki rowerowej w Kielcach ruchem turystycznym

Bicycle traffic volumes measured on bicycle path in Kielce appear
to be used by tourists

Abstract

The goal of this article is showing the volume of bicycle rides along bicycle paths in Kielce by tourists during May weekends in 2002 and 2003. Measuring activity took place within the period of April 26 thru May 4 at two locations, one along Silnica Creek at the vicinity of Wiosenna Street and in addition to this location during the period from May 1 to May 4, in the vicinity of "Kadzielnia" Park. In 2003 bicycle trips were monitored in similar spots as in the previous year. Monitoring of bicycle traffic was conducted by the Geography Department students at the Świętokrzyska Academy as a part of seminars in the subject of Societal-Economic Geography, lead by the author.
